1 Audience

This document is intended for business, technical and EDI personnel engaged in establishing an electronic connection with Hamburg Süd for the purpose of exchanging status messages for container movements via XML format.

The following chapters provide information regarding General Conventions and Message Specifications to receive rail events from the rail road providers. These data will be used for providing track & trace information to Hamburg Süd customers.

2 General Information

2.1 Functional Description

Date / Time information in <ShipmentTimestamp>

In general the date and time given in the tag <ShipmentTimestamp> will be assumed as the time, when the reported event occurred.

In case the ShipmentStatusCode tag is set to code “NF”, the given date and time will be assumed as the last free day expiration date and time.

In case the ShipmentStatusCode tag is set to code “AD”, the given date and time will be assumed as the estimated time of arrival (ETA) for the destination location reported.

Date / Time format

All Timestamps have to be reported in ISO8601-compliant format. Please report only local time, including the offset to UTC:

"[YYYY]-[MM]-[DD]T[hh]:[mm]:[ss]±[hh]:[mm]"

Example: 2016-05-30T22:45:13+06:00
 Central Standard Time (CST)

Reporting of ETA information

The current timestamp for the arrival at the destination location (ETA destination) should be reported in XML tag “<ETADestination>”. The ETA can change during the transport and should be reported as soon as it changes.

If available please also report the original ETA according to the schedule in the XML tag “<ETAOriginalSchedule>”. This ETA information should not change during transport.

Exception:

If you only want to transmit ETA information without any other rail event, please send an Event with Status Code “AD”. The ETA information still has to be defined in the XML tag “<ETADestination>”.

2.2 Processing Guidelines

Hamburg Süd is requesting to receive equipment status events in XML format from the rail road providers. A single message may contain several events. Please note that only valid XML files will be accepted and processed by Hamburg Süd.

The EDI partner has to ensure that all files are validated against the XSD schema, as invalid files will be disregarded.

EDI communication depends on Trading Partnership and will be mutually defined within a separate agreement. Common protocols for the transmission of messages are e.g. FTP or SFTP.

It's essential that the events are forwarded to Hamburg Süd as soon as they are available. The EDI trading partner can transfer the files to Hamburg Süd in fixed intervals not longer than 15 minutes or as soon as the event is available.

2.3 File name

The file names of the delivered XML files should have the following pattern:

“rail_<railroadID>_DATETIME<YYYY-MM-DD-HH-II-SS>_<Running number>.xml

Example:

- rail_CSXT_2015-08-24_21-45-26_0000001.xml

2.4 File size

The received XML files can contain multiple container events. The XML files should be limited in size by the rail provider to a maximum of 5 MB.

3 XSD Schema Description

The following chapters are defining the XSD schema and the elements with their attributes. Please note that the main schema to be referenced in your XML files needs to be "M_RAILEVENT_HSDG.xsd". That schema has elements that are referenced in further XSD schema files / namespaces.

The XML Schema describes the structure of an XML document. The XML Schema language is also referred to as XML Schema Definition (XSD).

The purpose of an XML Schema is to define the legal building blocks of an XML document:

- the elements and attributes that can appear in a document
- the number of (and order of) child elements
- data types for elements and attributes
- default and fixed values for elements and attributes

The actual XSD description file can be obtained from Hamburg Süd along with this implementation guide.

We recommend using professional XML parsing software to create and validate the XML files against the XSD definition.

Example XSD definition for an XML tag:

```
<xs:element name="EquipmentNumber">
  <xs:simpleType>
    <xs:restriction base="xs:string">
      <xs:length value="11"/>
    </xs:restriction>
  </xs:simpleType>
</xs:element>
```

The above XSD code is defining a tag named "EquipmentNumber". The data type is defined as a String with a fixed length of 11 characters.

3.1 Schema M_RAILEVENT_HSDG.xsd

The schema is importing other XSD schemas. Below all schemas are listed with their namespace and location.

schema location: [M_RAILEVENT_HSDG.xsd](#)
attribute form default: **unqualified**
element form default: **qualified**
targetNamespace: **http://www.hamburgsud.com/hsdg_rail_event**

3.2 Element HSDG_Rail_Events

diagram	
namespace	http://www.hamburgsud.com/hsdg_rail_event
properties	content complex
children	emh:MessageHeader eve:RailEvent
annotation	documentation Root element to contain external MessageHeader and at least one Rail event message

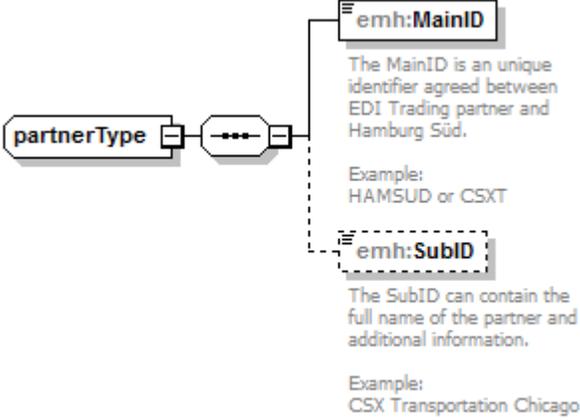

3.3 Element MessageHeader

The message header contains some general information of the received XML. It's defining the sending and receiving party, when the message was created and which version of the XSD specification was used.

namespace	http://www.hamburgsud.com/xml/external_message_header
type	emh:typeMessageHeader
properties	content complex
children	emh:MessageID emh:TimeStamp emh:Sender emh:Receiver emh:MessageType emh:MessageVersion emh:BusinessReference emh:MessageFunction emh:Environment
used by	element HSDG_Rail_Events
annotation	documentation The message header is containing important information to describe the received message.

3.3.1 complexType **partnerType**

diagram	 <p>The diagram shows a complexType named partnerType containing two elements: emh:MainID and emh:SubID. emh:MainID is a required element (indicated by a solid line and a small square) and is described as a unique identifier agreed between EDI Trading partner and Hamburg Süd. Example: HAMSUD or CSXT. emh:SubID is an optional element (indicated by a dashed line and a small square) and is described as containing the full name of the partner and additional information. Example: CSX Transportation Chicago.</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
children	emh:MainID emh:SubID
used by	elements typeMessageHeader/Receiver typeMessageHeader/Sender

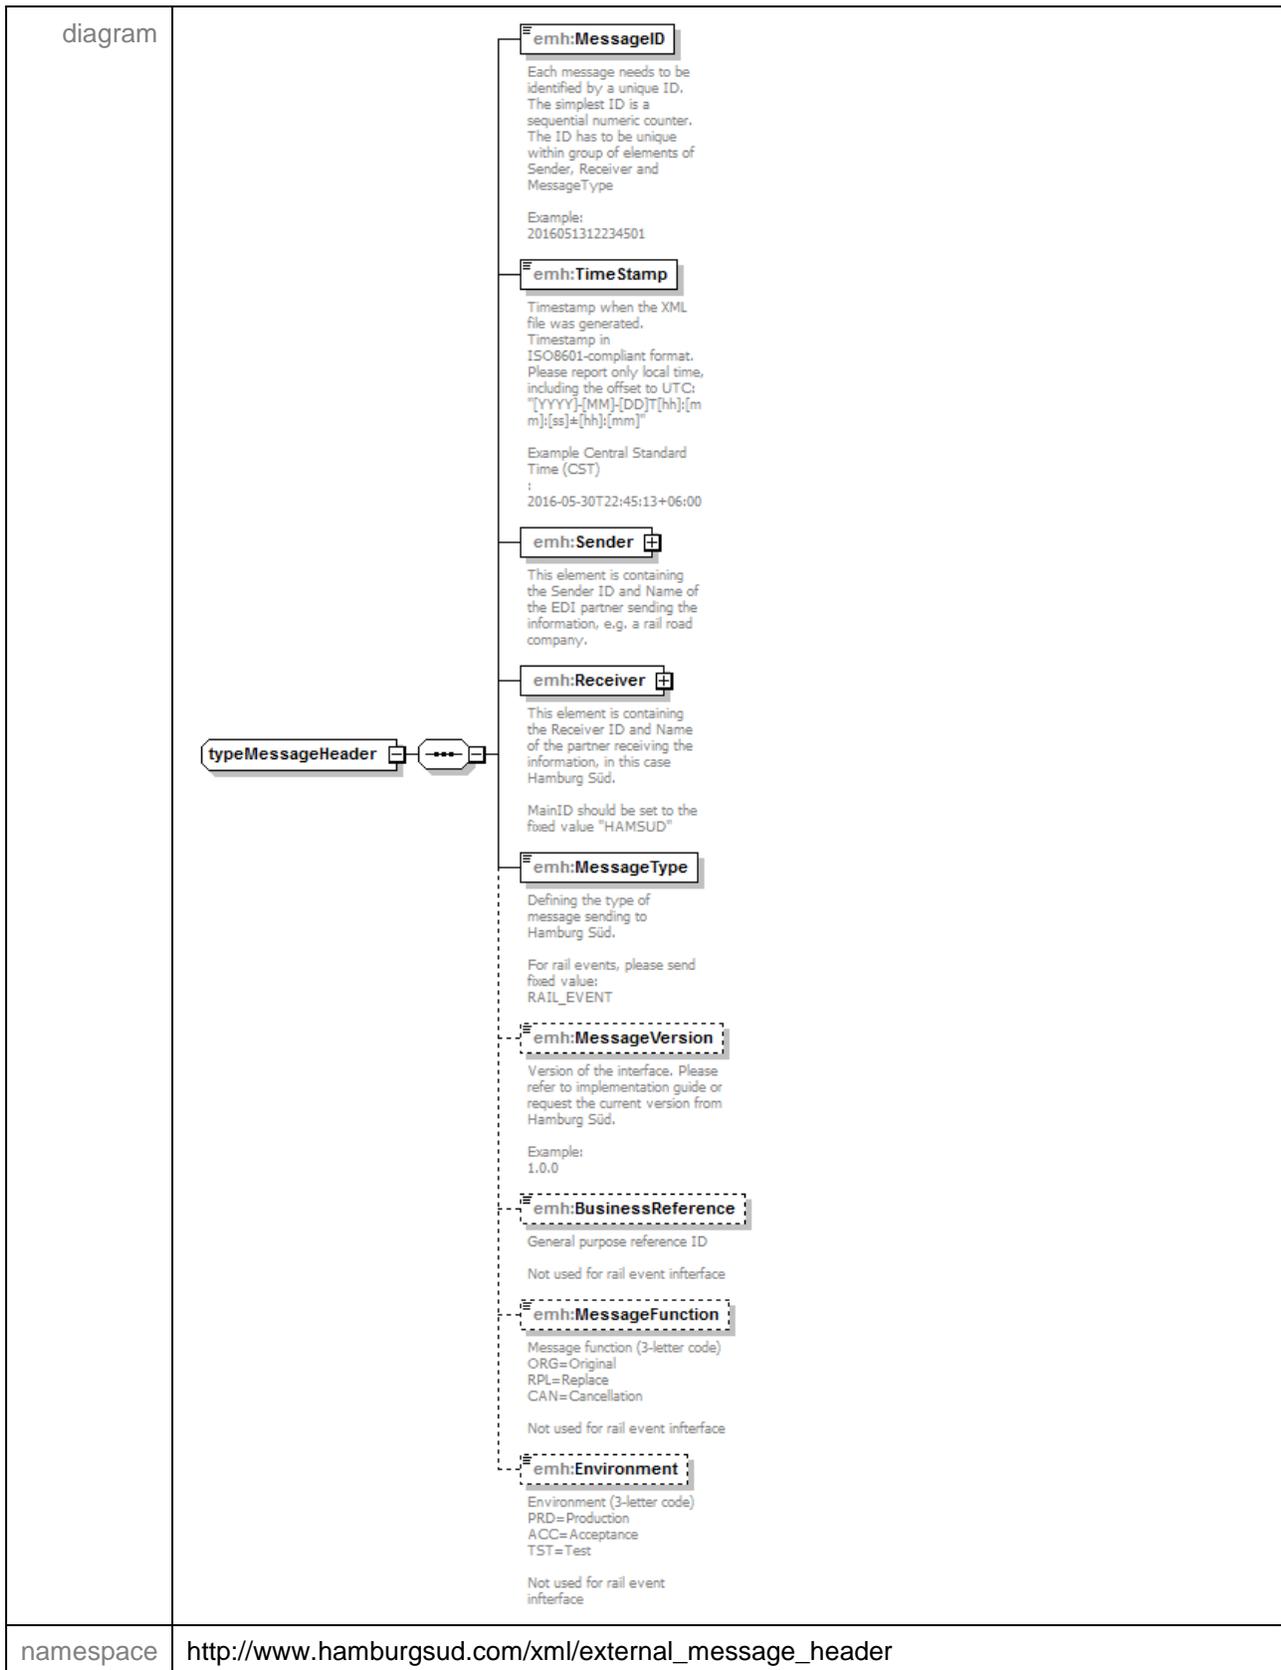

3.3.2 element partnerType/MainID

diagram	 <p>The MainID is an unique identifier agreed between EDI Trading partner and Hamburg Süd.</p> <p>Example: HAMSUD or CSXT</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
type	restriction of xs:string
properties	isRef 0 content simple
facets	Kind Value annotation minLength 1 maxLength 30
annotation	documentation The MainID is an unique identifier agreed between EDI Trading partner and Hamburg Süd. Example: HAMSUD or CSXT

3.3.3 element partnerType/SubID

diagram	 <p>The SubID can contain the full name of the partner and additional information.</p> <p>Example: CSX Transportation Chicago</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
type	restriction of xs:string
properties	isRef 0 minOcc 0 maxOcc 1 content simple
facets	Kind Value annotation minLength 1 maxLength 30
annotation	documentation The SubID can contain the full name of the partner and additional information. Example: CSX Transportation Chicago

3.3.4 complexType typeMessageHeader

children	emh:MessageID emh:TimeStamp emh:Sender emh:Receiver emh:MessageType emh:MessageVersion emh:BusinessReference emh:MessageFunction emh:Environment
used by	element MessageHeader

3.3.5 element typeMessageHeader/MessageID

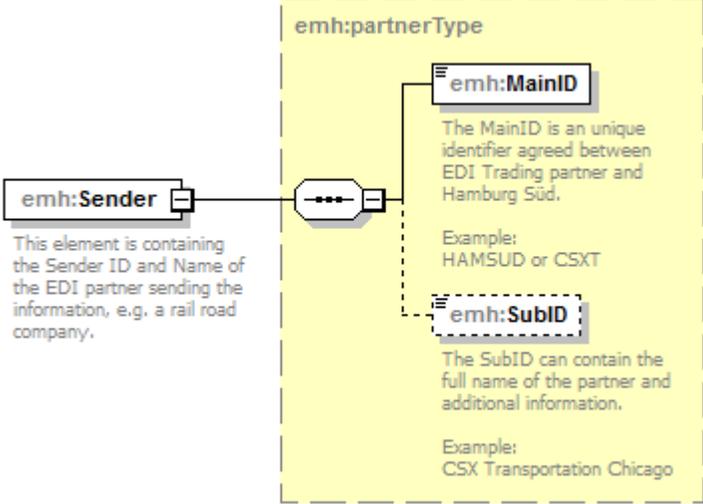

diagram	 <p>Each message needs to be identified by a unique ID. The simplest ID is a sequential numeric counter. The ID has to be unique within group of elements of Sender, Receiver and MessageType</p> <p>Example: 2016051312234501</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
type	restriction of xs:string
properties	isRef 0 content simple
facets	Kind Value annotation minLength 1 maxLength 50
annotation	documentation Each message needs to be identified by a unique ID. The simplest ID is a sequential numeric counter. The ID has to be unique within group of elements of Sender, Receiver and MessageType
	Example: 2016051312234501

3.3.6 element typeMessageHeader/TimeStamp

diagram	 <p>Timestamp when the XML file was generated. Timestamp in ISO8601-compliant format. Please report only local time, including the offset to UTC: "[YYYY]-[MM]-[DD]T[hh]:[m m]:[ss]±[hh]:[mm]"</p> <p>Example Central Standard Time (CST) : 2016-05-30T22:45:13+06:00</p>
---------	--

namespace	http://www.hamburgsud.com/xml/external_message_header
type	xs:dateTime
properties	isRef 0 content simple
annotation	documentation Timestamp when the XML file was generated. Timestamp in ISO8601-compliant format. Please report only local time, including the offset to UTC: "[YYYY]-[MM]-[DD]T[hh]:[mm]:[ss]±[hh]:[mm]" Example Central Standard Time (CST) : 2016-05-30T22:45:13+06:00

3.3.7 element typeMessageHeader/Sender

diagram	 <p>The diagram illustrates the structure of the <code>emh:partnerType</code> element. It is shown as a dashed yellow box containing two sub-elements: <code>emh:MainID</code> and <code>emh:SubID</code>. A solid line connects the <code>emh:Sender</code> element to the <code>emh:partnerType</code> element. The <code>emh:MainID</code> is described as a unique identifier agreed between EDI Trading partner and Hamburg Süd, with examples HAMSUD or CSXT. The <code>emh:SubID</code> is described as containing the full name of the partner and additional information, with the example CSX Transportation Chicago.</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
type	emh:partnerType
properties	isRef 0 content complex
children	emh:MainID emh:SubID
annotation	documentation This element is containing the Sender ID and Name of the EDI partner sending the information, e.g. a rail road company.

3.3.8 element typeMessageHeader/Receiver

<p>diagram</p>	<p>emh:Receiver</p> <p>This element is containing the Receiver ID and Name of the partner receiving the information, in this case Hamburg Süd.</p> <p>MainID should be set to the fixed value "HAMSUD"</p> <p>emh:partnerType</p> <p>emh:MainID</p> <p>The MainID is an unique identifier agreed between EDI Trading partner and Hamburg Süd.</p> <p>Example: HAMSUD or CSXT</p> <p>emh:SubID</p> <p>The SubID can contain the full name of the partner and additional information.</p> <p>Example: CSX Transportation Chicago</p>
<p>namespace</p>	<p>http://www.hamburgsud.com/xml/external_message_header</p>
<p>type</p>	<p>emh:partnerType</p>
<p>properties</p>	<p>isRef 0 content complex</p>
<p>children</p>	<p>emh:MainID emh:SubID</p>
<p>annotation</p>	<p>documentation This element is containing the Receiver ID and Name of the partner receiving the information, in this case Hamburg Süd.</p> <p>MainID should be set to the fixed value "HAMSUD"</p>

3.3.9 element typeMessageHeader/MessageType

<p>diagram</p>	<p>emh:MessageType</p> <p>Defining the type of message sending to Hamburg Süd.</p> <p>For rail events, please send fixed value: RAIL_EVENT</p>
<p>namespace</p>	<p>http://www.hamburgsud.com/xml/external_message_header</p>
<p>type</p>	<p>restriction of xs:string</p>
<p>properties</p>	<p>isRef 0 content simple</p>
<p>facets</p>	<p>Kind Value annotation minLength 1 maxLength 30</p>
<p>annotation</p>	<p>documentation Defining the type of message sending to Hamburg Süd.</p>

	For rail events, please send fixed value: RAIL_EVENT
--	---

3.3.10 element typeMessageHeader/MessageVersion

diagram	 <p>Version of the interface. Please refer to implementation guide or request the current version from Hamburg Süd.</p> <p>Example: 1.0.0</p>
namespace	http://www.hamburgsud.com/xml/external_message_header
type	restriction of xs:string
properties	isRef 0 minOcc 0 maxOcc 1 content simple
facets	Kind Value annotation minLength 1 maxLength 30
annotation	documentation Version of the interface. Please refer to implementation guide or request the current version from Hamburg Süd. Example: 1.0.0

3.3.11 element typeMessageHeader/BusinessReference

diagram	 <p>General purpose reference ID</p> <p>Not used for rail event interface</p>
namespace	http://www.hamburgsud.com/xml/external_message_header

minLength	1						

	maxLength 3
annotation	documentation Environment (3-letter code) PRD=Production ACC=Acceptance TST=Test Not used for rail event interface

3.4 Element RailEvent

The RailEvent tag contains the rail event data on a container level. This data set includes the last location of the container during the rail transport and when the container passed the reported location. This tag also contains some additional information, such as booking number, B/L number, additional locations, etc. Every XML file can contain multiple events (“<RailEvent>”).

namespace	http://www.hamburgsud.com/xml/rail_event
type	eve:typeRailEvent
properties	content complex
children	eve:ShipmentTimestamp eve:ShipmentStatusCode eve:Equipment eve:ActivityLocationName eve:ActivityLocationState eve:ActivityLocationCountry eve:ActivityLocationUNLOCODE eve:OriginCity eve:OriginState eve:OriginCountry eve:OriginUNLOCODE eve:DestinationCity eve:DestinationState eve:DestinationCountry eve:DestinationUNLOCODE eve:RailRoad eve:MotorCarrier eve:Consignee eve:Shipper eve:BookingNumber eve:BillofLadingNumber eve:PickupReferenceNumber eve:WaybillNumber eve:SealNumber eve:ETADestination eve:ETAOriginalSchedule
used by	element HSDG Rail Events
annotation	documentation Description of elements and attributes of an rail event

namespace	http://www.hamburgsud.com/xml/rail_event

diagram	 <p>Timestamp for ETA according to the schedule.</p> <p>Timestamp in ISO8601-compliant format. Please report only local time, including the offset to UTC: "[YYYY]-[MM]-[DD]T[hh]:[mm]:[ss]±[hh]:[mm]"</p> <p>Example: 2016-01-26T23:30:47+06:00</p>
namespace	http://www.hamburgsud.com/xml/rail_event
type	xs:dateTime
properties	isRef 0 minOcc 0 maxOcc 1 content simple
annotation	documentation Timestamp for ETA according to the schedule. Timestamp in ISO8601-compliant format. Please report only local time, including the offset to UTC: "[YYYY]-[MM]-[DD]T[hh]:[mm]:[ss]±[hh]:[mm]" Example: 2016-01-26T23:30:47+06:00

4 Appendix

4.1 Status Event Codes

The following rail events are supported by Hamburg Süd.

Status Code	Description
A	Container has arrived at the location specified (interim)
I	In-Gate
J	Delivered to connecting line / delivered for rail transfer
P	Container has departed from the location specified (interim)
R	Received from prior carrier / received for rail transfer
AL	Container loaded on rail
AR	Rail arrived at Destination Intermodal Ramp
NF	Free time to expire
NT	Notification
OA	Out-Gate
RL	Rail departed from Origin Intermodal Ramp
UR	Container unloaded from rail
AD	<i>ETA information only</i> <i>If you only want to transmit ETA information without any other rail event, please send an Event with Status Code "AD". The ETA information still has to be defined in the XML tag "<ETADestination>".</i>

4.2 Example messages

4.2.1 Message “Rail Arrival at Intermediate Rail Location with ETA”:
